SUBJECT: Oil Cooler Pressure Spike Protection Kit 98680007

There have been reported failures of oil coolers resulting from pressure spikes in the return line of these machines. This kit will limit these spikes to 65 psi, which is well below the pressure rating of the cooler.

The Oil Cooler Protection Kit contains a special 65 psi check valve which remains closed under normal conditions and allows oil flow through the cooler. When a pressure spike above 65 psi occurs, the check valve opens and routes the oil directly back to tank, temporarily bypassing the cooler. Once the pressure spike has dissipated, the check valve closes and oil flow returns to the cooler.

This kit can be installed in approximately one hour and includes all the parts and instructions for installation.

Please contact your NORDCO representative or the NORDCO Parts Department for price and availability.
